

Java Assignment 07

Create a class "spring.training.dao.impl.ProductDaoJdbcTemplateImpl" which implements spring.training.dao.ProductDao. All the methods of this interface are implemented using the JdbcTemplate, which is a member variable of the same class.

```
public class ProductDaoJdbcTemplateImpl implements ProductDao {  
  
    private JdbcTemplate template;  
  
    public ProductDaoJdbcTemplateImpl() { }  
  
    public ProductDaoJdbcTemplateImpl(JdbcTemplate template) {  
        this.template = template;  
    }  
  
    // setter for the field "template"  
  
    // implementation for all the methods of ProductDao  
  
}
```

In the AppConfig class, create a bean function to return an instance of ProductDaoJdbcTemplateImpl, autowire the same with JdbcTemplate, which in turn is autowired with DataSource.

Write a program to test all the functionalities of the class ProductDaoJdbcTemplateImpl.
